QRAEMON

THE EXPERIENCE LAYER FOR PHYSICAL AI

Machines that learn from experience.

Robots can see now. They still can't remember.

An experience layer is software that lets any robot or machine keep, reuse and improve what it learns on the job, so integration costs fall.

Raising $62,000

IDEATION STAGE · PRE-SEED

TEAM

Two builders. One mission.

One team builds the mind, and the machine it runs on.

Mokshagna Anurag Kankati

Co-founder · Cognitive Systems

Builds the memory: how a machine stores and recalls what it has experienced.

B.Tech ECE, MVGR College. 3+ years in robotics and UAVs. Interned at NITK, IIT Tirupati (CubeSat), Zebu Intelligent Systems and Daloft Aerospace. 2nd place, AVISHKAR.

Dinesh Polavarapu

Co-founder · Robotics & Mechanical Systems

Builds the machine: the hardware, controls and embedded systems the memory runs on.

B.Tech Mechanical, IIT Tirupati. Won the Nation Builder competition with Guardian, an AI health wearable. Built LifeLine AI, a healthcare assistant. Arduino PID control builds.

This raise adds a core engineering team to build the first robot integration.

PROBLEM

Robots start from zero. Every time.

Every repeated miss costs engineer hours, line downtime and rework.

Day 1

1 failed attempt

Day 100

The same miss, again

Day 1,000

Still the same miss

Each gold dot is one failed attempt at the same task.

50%+

of a robot system's cost is integration and programming, not hardware.

4–5×

A full robot system typically costs 4–5 times the price of the robot itself.

73%

of manufacturers surveyed say programming a robot takes a week to a month.

SOLUTION · MEMORY BETWEEN SENSORS AND MOTORS

Give any robot a memory to learn and adapt.

Sees

Cameras and sensors

Example: the part sits 4 mm off-center.

THE CORE INNOVATION

Remembers and decides

QRAEMON

Example: last time, a straight push jammed. Shift 4 mm first.

Moves

Existing controller and safety

Example: moves 4 mm, then pushes. No jam.

WHAT IT IS

Software on top of a robot's existing sensors and controller. It never replaces them.

HOW IT WORKS

Forms experiences and links them by relation. In a new situation, related memories fire together and decide the move.

ANY ROBOT, ANY MACHINE

One brain, one thin adapter per robot. Runs as software or as a fully offline onboard module.

Target: 50% fewer failed trials than no memory. A goal, to be proven in simulation first.

WHY NOW

Seeing is solved. Remembering is not.

PERCEPTION · SOLVED

5M

Robots can already see and follow instructions.

5 million industrial robots work in factories worldwide, up 9% in 2025. India had 52,570 at the end of 2024.

HARDWARE · AFFORDABLE

~$320

Seeing is now affordable.

A depth camera like the Intel RealSense D435 costs about $320, so every robot can have eyes.

MEMORY · THE MISSING PIECE

27%

Learning after deployment is unsolved.

India's installs grow 27% a year, adding a wave of blank robots every year. India installed almost 10,500 in 2025, sixth in the world.

MARKET · BARS NOT TO SCALE

Start in India. Then every machine.

TAM · EVERY ROBOT

5,000,000 robots ≈ $5B a year

operate in factories worldwide, with 600,000+ installed in 2025.

SAM · INDUSTRIAL ROBOTS IN INDIA

52,570 robots ≈ $52.6M a year

operating at the end of 2024, with almost 10,500 more installed in 2025.

SOM · 1% OF INDIA

526 robots ≈ $0.5M a year

526 × $1,000. First step: one pilot.

$1.2B → $5.8B

Cobot market forecast, the growth driver for our SAM. Dollar values assume $1,000 per robot per year: illustrative, not a forecast.

PRODUCT

Fail once. Remember. Succeed.

Trial 1

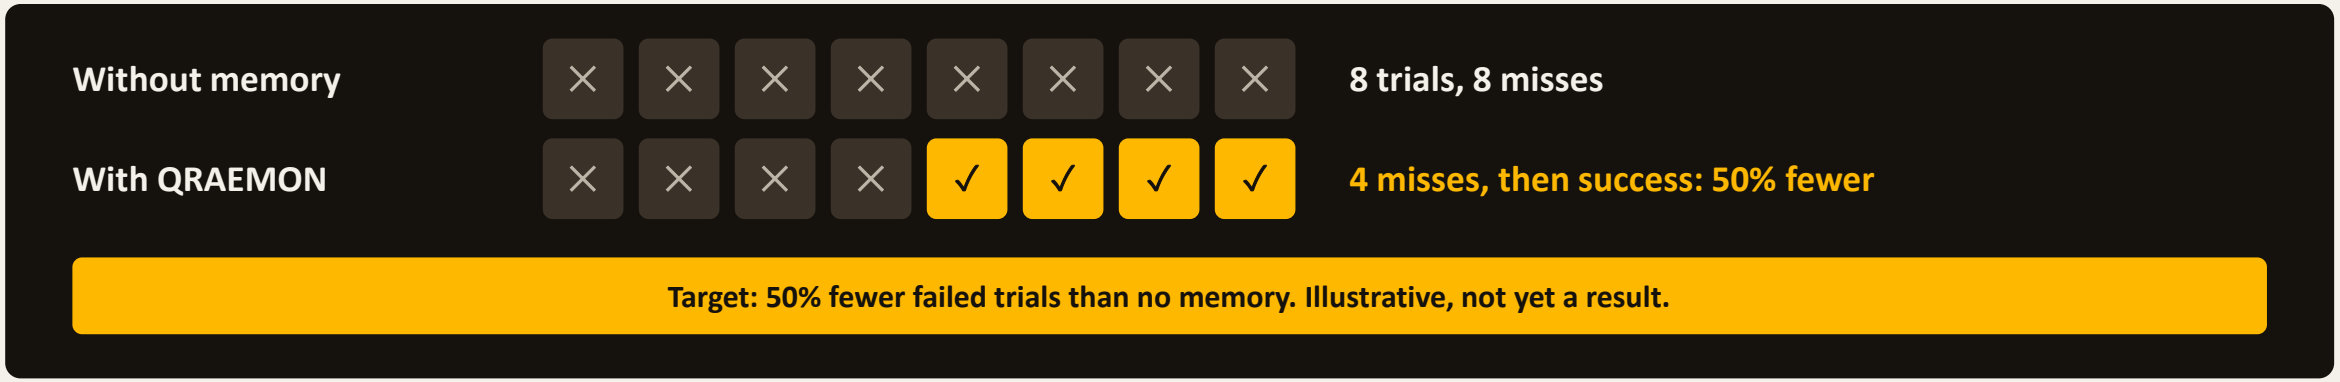

A new variation. The robot misses.

Memory

Each miss becomes a linked memory, recalled on the next try.

Trial 5

Having learned from trials 1 to 4, the robot succeeds.

QRAEMON Software

Runs on a robot's computer, a workstation, an edge box or in simulation.

QRAEMON Embedded

The same brain on a compact onboard module. Fully offline, no cloud needed.

COMPETITION

Memory is not the moat. The lifecycle is.

Works across robot makers

Foundation-model robotics

General skills, trained before deployment.

QRAEMON

Memory layers store and recall. We add the lifecycle: score, merge, forget.

Robot-maker stacks and scripts

Tied to one vendor, or reprogrammed by hand.

Lifelong-learning research

Strong methods, studied in labs.

Learns on the job →

WHO ELSE IS IN THE SPACE

Foundation-model robotics

Gemini Robotics, NVIDIA GR00T, Skild AI

Robot memory layers

Monolithos Robot Brain, robotmem, Memori. They store and recall only.

Robot-maker stacks and scripts

FANUC, ABB, Universal Robots, RoboDK

Lifelong-learning research

Academic work, e.g. Nature Machine Intelligence, 2025

Our moat: every deployment adds experience that only real machines can generate.

BUSINESS MODEL

Software per robot. Pilots first.

1 · PAID PILOTS

$3–5K

assumed fee per pilot

8–12 week proof of value with a lab, integrator or manufacturer. Converts to a license.

2 · PER-ROBOT LICENSE

$1,000

assumed per robot per year

List price and the core recurring revenue. Any partner share comes out of this.

3 · INTEGRATOR PARTNERS

10–20%

assumed share, paid from the license

Integrators embed and resell QRAEMON. We keep $800–900 per robot.

YEARLY REVENUE IF INDIA'S ROBOTS ADOPT QRAEMON

$263K	0.5% · 263 robots	
$526K	1% · 526 robots	
$1.05M	2% · 1,051 robots	

Pricing logic: a fraction of the downtime cost each reprogramming causes. All prices are starting assumptions.

GO TO MARKET

Start narrow. Prove it. Then scale.

NOW TO MONTH 9

1 · Design partners

Research labs and robotics startups.

Technical proof · 1–3 partners

MONTH 9–15

2 · Paid pilots

Robotics companies and industrial R&D groups.

Economic proof · 10–20 pilots

AFTER THIS RAISE

3 · Per-robot licenses

Manufacturers, with integrators selling it in the cells they build.

Recurring revenue · 100+ robots

SEED AND BEYOND

4 · Platform

OEM and fleet licensing, on any machine worldwide.

Scale · many robots

FIRST CUSTOMERS

Robotics startups and research labs in India: they have robots, repeated failures and fast decisions.

DISTRIBUTION

System integrators embed QRAEMON in the robot cells they build, and share 10–20% of the license.

FIRST 20–30 CALLS

Ask one question: what happens when this robot hits a failure it has seen before?

THE RAISE

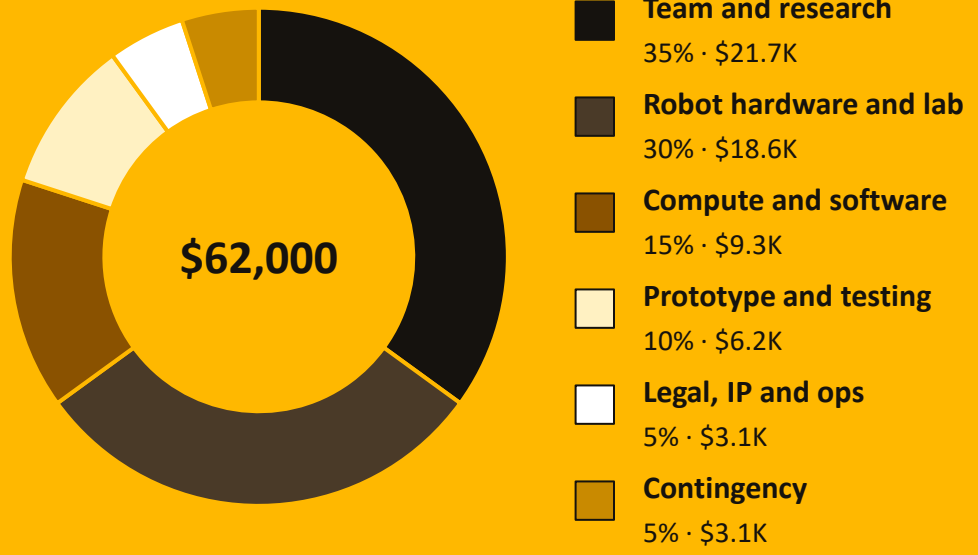

$62,000.
One proof.

Ideation stage, student founders. Pre-seed funds the first build and a core team. In 15 months it delivers:

1. **Runtime on a real robot · month 6**
2. **Gains over 3 baselines · month 9**
3. **One external pilot · month 15**

Then: a seed round, raised on real-robot evidence and a pilot.

USE OF FUNDS

Total $62,000. 90% goes to people, robot hardware, compute and testing.
